

LED STRIPS

Design your rooms with light!

LED strips are versatile and convertible: Use them as eye-catching accents or as ambient light in the background! Depending on the type and shape of the strips, they are ideal for designing your rooms or outdoor areas with light.

The LED strips can be divided, connected and extended. You can either solder them or string them together with the optional connectors available for many models. Just pay attention to the width and the contacts of your strips. As a general rule: Strips with 12 V power supply can be divided at shorter intervals than strips with 24 V. However, the latter are better suited for longer distances (more than 5 meters).

The closer the individual LED dots are to each other on a strip, the more flat the lighting appears. If the individual LEDs sit further apart, they appear more like dots. Both can be advantageous depending on the application.

White strips

Use white light to create the atmosphere in your rooms. Create a cosy atmosphere with warm white LEDs or a neutral cool impression with cold white LEDs:

1800-2500 K: extra warm light - makes you feel comfortable, cozy

2700-3200 K: warm light - like a conventional bulb

4000 K: neutral light - well suited for workstations

5000-6500 K: cold light - has a vitalising and modern effect

Colored strips

Colored LED strips bring your design to life. Whether as ambient light behind pieces of furniture or as bar lighting in the discotheque: With coloured LED strips you set shining accents! In our assortment you will find strips with different color mixtures. In addition to the classic RGB strips, we also offer strips with RGBW LEDs (with cold white LEDs) and RGBWW LEDs (with warm white LEDs).
